The WebPDF-4+ 2016 is a Java Web Start program, which allows the end user to connect to the ICDD WebPDF-4+ 2016 database. This presentation will address various fundamentals required when working with this product. The Java Network Launching Protocol (JNLP) file, located on our server, determines if your computer has the latest WebPDF-4+ 2016 Java front-end software. The software and database resides on an ICDD server. The database is equivalent to the PDF-4+ 2016 database. When the WebPDF-4+ 2016 is launched, it will show your license and determine if you have the latest software installed on your computer before starting. The WebPDF-4+ 2016 is licensed through an ICDD dongle and renewals are handled via the internet. The dongle needs to be connected to the computer using the software.

The WebPDF-4+ 2016 requires you have a high-speed internet connection. You also need to check for latency issues using *tracert* command to our server before purchasing. The PDF-4+ is a large database with complex database structures. If the latency is too high from using the *tracert* command, then the WebPDF-4+ 2016 may not be suitable for you. Your organization must permit two TCP/IP connection ports to be open on all firewalls. The first port checks the license and the other allows you to connect to the WebPDF-4+ 2016 database. Currently, WebPDF-4+ is compatible with a majority of third party software packages, but you will need to check with the vendor to make certain that their software can interact with WebPDF-4+ 2016.
